
Topic models are models for text (and related problems). They let us

1. Discover the thematic structure in text.
2. Annotate the documents according to themes.
3. Use these annotations to visualize, organize, summarize, etc.

BUSINESS DAY

A Digital Shift on Health Data Swells Profits in an Industry

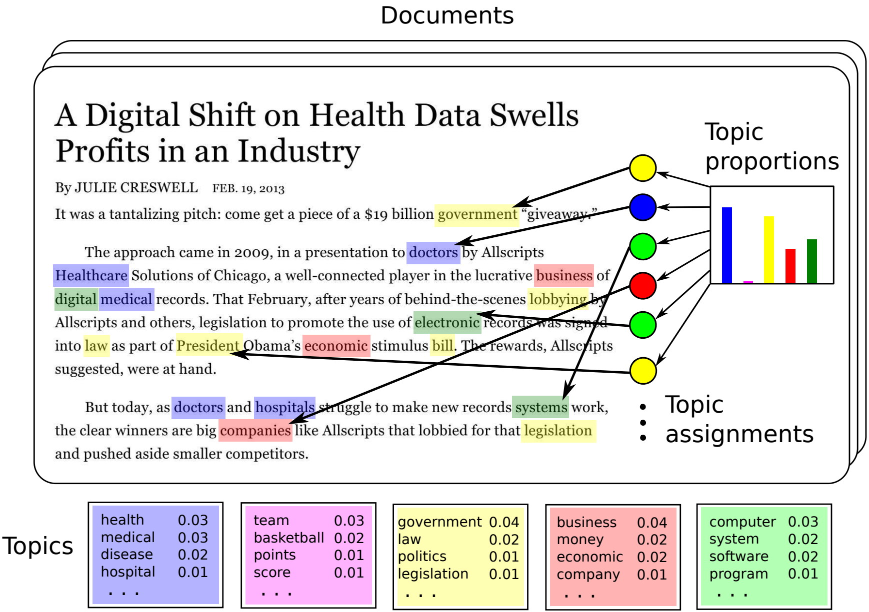
By JULIE CRESWELL FEB. 19, 2013

It was a tantalizing pitch: come get a piece of a $19 billion government "giveaway."

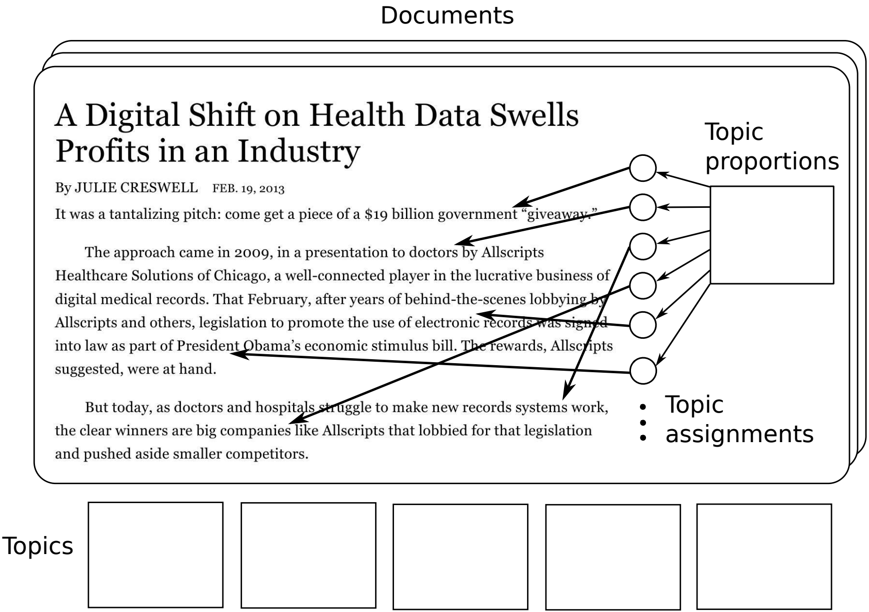
The approach came in 2009, in a presentation to doctors by Allscripts Healthcare Solutions of Chicago, a well-connected player in the lucrative business of digital medical records. That February, after years of behind-the-scenes lobbying by Allscripts and others, legislation to promote the use of electronic records was signed into law as part of President Obama's economic stimulus bill. The rewards, Allscripts suggested, were at hand.

But today, as doctors and hospitals struggle to make new records systems work, the clear winners are big companies like Allscripts that lobbied for that legislation and pushed aside smaller competitors.

Documents exhibit multiple topics



Topic Modeling



Topic Modeling

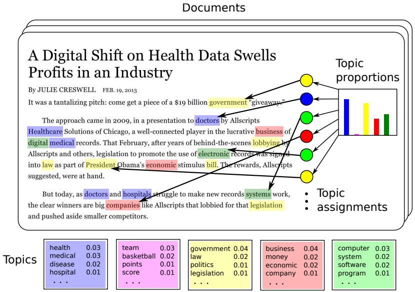
There are three key ingredients to any topic model.

1. **Topics:** Probability distributions on vocabulary.
2. **Topic proportions:** Probability distributions on the topics.
3. **Topic assignments:** Assigns each observed word to a topic.

Topics are **global** variables. All documents share the same topics.

Topic proportions are **local** variables. They change with each document.

Topic assignments are also local and help us learn the first two.



Most topic models are **bag-of-words** models. This means that *which* words are contained in the document matters, but their *order* does not.

PRO BASKETBALL

N.B.A. to Move All-Star Game From North Carolina

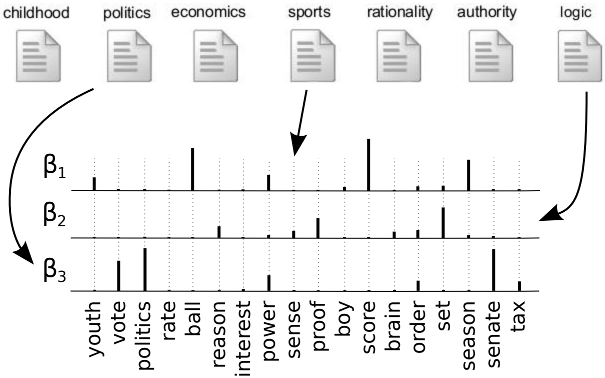
By SCOTT CACCIOLA and ALAN BLINDER JULY 21, 2016

The National Basketball Association on Thursday dealt a blow to the economy and prestige of North Carolina by pulling next February's All-Star Game from Charlotte to protest a state law that eliminated anti-discrimination protections for lesbian, gay, bisexual and transgender people.

Latent Dirichlet Allocation (LDA)

As with other topic models, LDA has

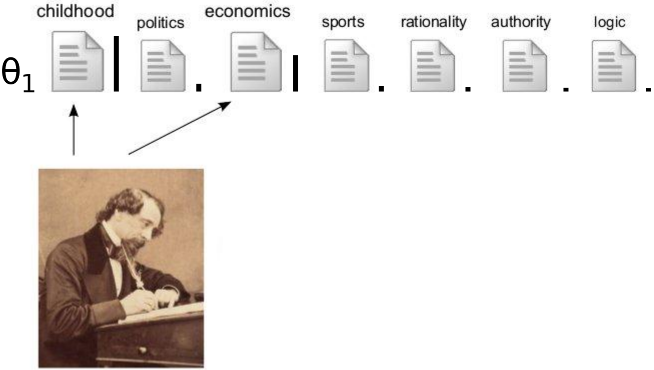
1. A collection of distributions on words called topics.
2. A distribution on topics for each document.



Latent Dirichlet Allocation (LDA)

As with other topic models, LDA has

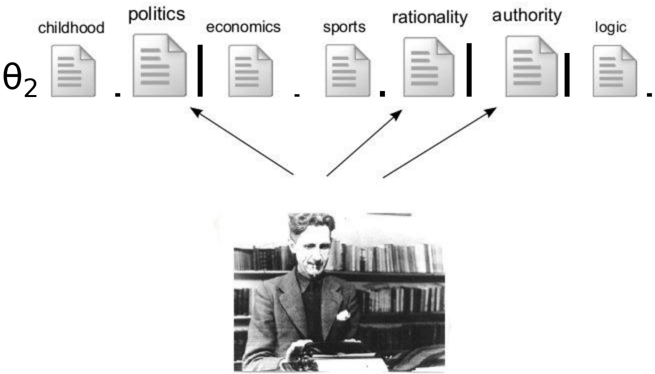
1. A collection of distributions on words called topics.
2. A distribution on topics for each document.



Latent Dirichlet Allocation (LDA)

As with other topic models, LDA has

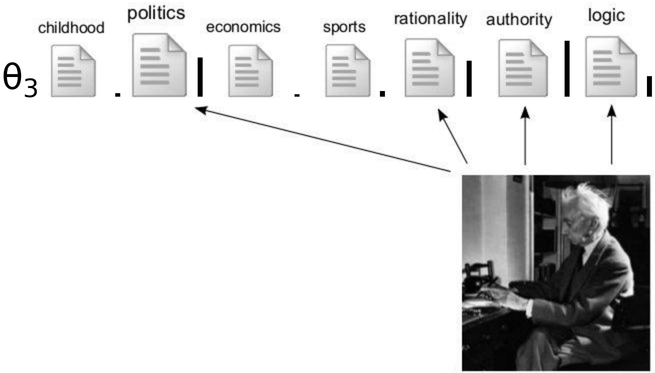
1. A collection of distributions on words called topics.
2. A distribution on topics for each document.



Latent Dirichlet Allocation (LDA)

As with other topic models, LDA has

1. A collection of distributions on words called topics.
2. A distribution on topics for each document.



As with any Bayesian model, we have to define the process for generating data and hidden model variables before we can learn them.

Generative process for LDA

1. Generate each topic — a distribution on words in a vocabulary

$$\beta_k \sim \text{Dirichlet}(\gamma), \quad k = 1, \dots, K$$

2. For each document, generate a distribution on topics

$$\theta_d \sim \text{Dirichlet}(\alpha), \quad d = 1, \dots, D$$

3. For the nth word in the dth document,

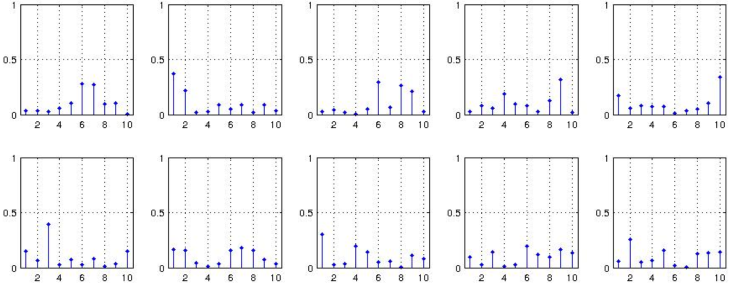
   a) Allocate the word to a topic, $c_{dn} \sim \text{Discrete}(\theta_d)$
   b) Generate the word from the selected topic, $x_{dn} \sim \text{Discrete}(\beta_{c_{dn}})$

Dirichlet distribution: A continuous distribution on discrete probability vectors. Let β_k be a probability vector and γ a positive parameter vector,

$$p(\beta_k|\gamma) = \frac{\Gamma(\sum_v \gamma_v)}{\prod_{v=1}^{V} \Gamma(\gamma_v)} \prod_{v=1}^{V} \beta_{k,v}^{\gamma_v - 1}$$

This defines the Dirichlet distribution. Some examples of β_k generated from this distribution for a constant value of γ and $V = 10$ are given below.

$\gamma = 1$

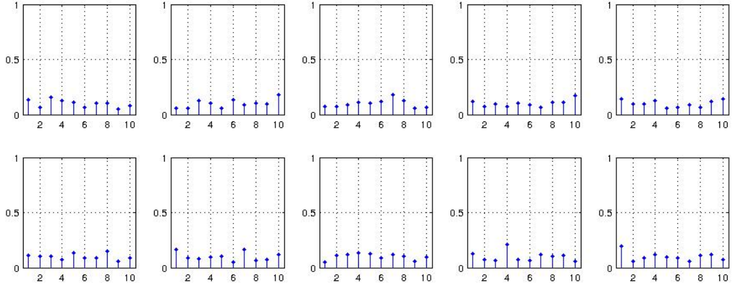


Dirichlet distribution: A continuous distribution on discrete probability vectors. Let β_k be a probability vector and γ a positive parameter vector,

$$p(\beta_k|\gamma) = \frac{\Gamma(\sum_v \gamma_v)}{\prod_{v=1}^{V} \Gamma(\gamma_v)} \prod_{v=1}^{V} \beta_{k,v}^{\gamma_v - 1}$$

This defines the Dirichlet distribution. Some examples of β_k generated from this distribution for a constant value of γ and $V = 10$ are given below.

$\gamma = 10$

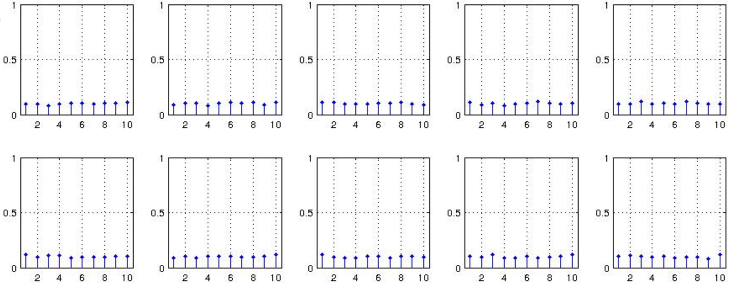


Dirichlet distribution: A continuous distribution on discrete probability vectors. Let β_k be a probability vector and γ a positive parameter vector,

$$p(\beta_k|\gamma) = \frac{\Gamma(\sum_v \gamma_v)}{\prod_{v=1}^{V} \Gamma(\gamma_v)} \prod_{v=1}^{V} \beta_{k,v}^{\gamma_v - 1}$$

This defines the Dirichlet distribution. Some examples of β_k generated from this distribution for a constant value of γ and $V = 10$ are given below.

$\gamma = 100$

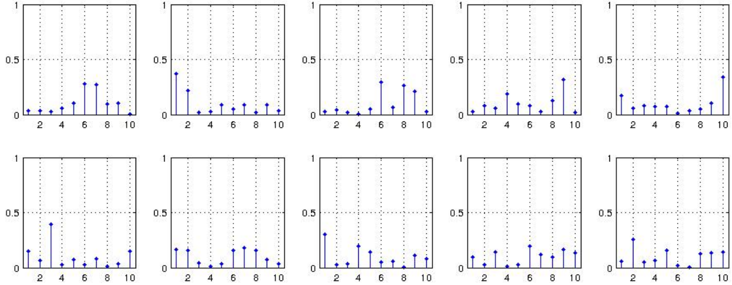


Dirichlet distribution: A continuous distribution on discrete probability vectors. Let β_k be a probability vector and γ a positive parameter vector,

$$p(\beta_k|\gamma) = \frac{\Gamma(\sum_v \gamma_v)}{\prod_{v=1}^{V} \Gamma(\gamma_v)} \prod_{v=1}^{V} \beta_{k,v}^{\gamma_v - 1}$$

This defines the Dirichlet distribution. Some examples of β_k generated from this distribution for a constant value of γ and $V = 10$ are given below.

$\gamma = 1$

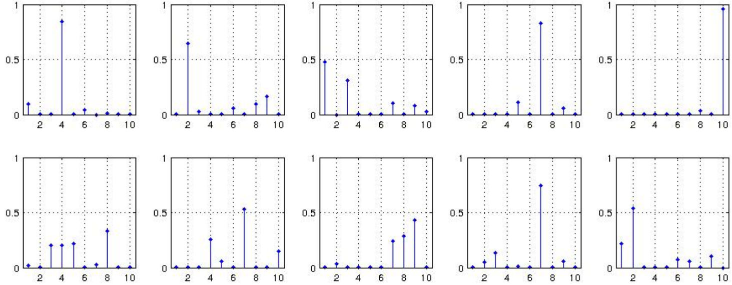


Dirichlet distribution: A continuous distribution on discrete probability vectors. Let β_k be a probability vector and γ a positive parameter vector,

$$p(\beta_k|\gamma) = \frac{\Gamma(\sum_v \gamma_v)}{\prod_{v=1}^{V} \Gamma(\gamma_v)} \prod_{v=1}^{V} \beta_{k,v}^{\gamma_v - 1}$$

This defines the Dirichlet distribution. Some examples of β_k generated from this distribution for a constant value of γ and $V = 10$ are given below.

$\gamma = 0.1$

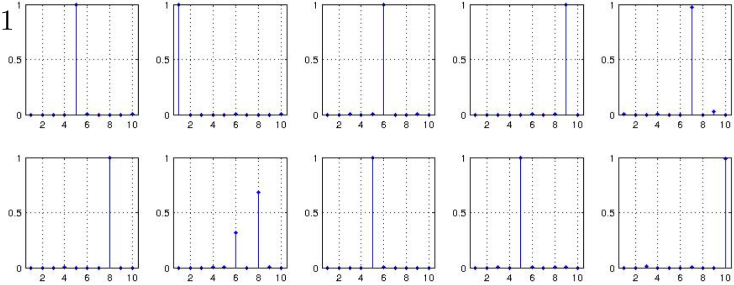


Dirichlet distribution: A continuous distribution on discrete probability vectors. Let β_k be a probability vector and γ a positive parameter vector,

$$p(\beta_k|\gamma) = \frac{\Gamma(\sum_v \gamma_v)}{\prod_{v=1}^{V} \Gamma(\gamma_v)} \prod_{v=1}^{V} \beta_{k,v}^{\gamma_v - 1}$$

This defines the Dirichlet distribution. Some examples of β_k generated from this distribution for a constant value of γ and $V = 10$ are given below.

$\gamma = 0.01$



Why does LDA "work"?

- LDA trades off two goals.

  1. In each **document**, allocate its words to a **few topics**.
  2. In each **topic**, assign high probability to a **few words**.

- These goals are competing with one another.

  - Putting a document in a single topic makes #2 hard:
    All of its words must have probability under that topic.
  - Putting very few words in each topic makes #1 hard:
    To cover a documents words, it must assign many topics to it.

- Trading off these goals finds groups of co-occurring words.
